- Among the States/UTs, in 2017, Mizoram has shown the highest estimated adult HIV prevalence of 2.04%(1.57-2.56), followed by Manipur (1.43%, 1.17-1.75), Nagaland (1.15%, 0.92-1.41), Telangana (0.70%, 0.50-0.95) and Andhra Pradesh (0.63%, 0.47-0.85).

History

- The history of the HIV and AIDS epidemic began in illness, fear and death as the world faced a new and unknown virus. However, scientific advances, such as the development of antiretroviral drugs, have enabled people with access to treatment to live long and healthy lives with HIV.

- It is widely believed that HIV originated in Kinshasa, in the Democratic Republic of Congo around 1920 when HIV crossed species from chimpanzees to humans. Up until the 1980s, we do not know how many people were infected with HIV or developed AIDS. HIV was unknown and transmission was not accompanied by noticeable signs or symptoms.

What Is HIV?

- HIV (human immunodeficiency virus) is a virus that attacks cells that help the body fight infection, making a person more vulnerable to other infections and diseases. It is spread by contact with certain bodily fluids of a person with HIV, most commonly during unprotected sex (sex without a condom or HIV medicine to prevent infection) or through sharing needles and drug equipment.

WHAT IS HIV?

Human Immunodeficiency Virus (HIV) is a virus that attacks cells that help the body fight infection.

There's no cure, but it is treatable with medicine.

Structure of HIV

HIV- Agent

- It is a RNA virus
- Which replicates in actively dividing T₄ lymphocytes.
- Unique ability to destroy T₄ Helper cells
- Reservoir- Once a person gets infected virus remains in his body lifelong. And the person is a symptomless carrier for years before the symptoms actually appear.

- Source – The virus is found in great concentrations in blood, CSF and semen.
- Lower concentrations have been found in tears, saliva, breast milk, urine, cervical and vaginal secretions.
- Also isolated from brain tissue, lymph nodes, bone marrow cells and skin.
- However only blood and semen are known to transmit the virus.

Epidemiology

- Males>females
- Occurs in all ages and ethnic groups
- All areas of the country are affected
- AIDS is now the second leading cause of death for all men aged 25-44 years
- (Unintended injuries is #1 and heart disease is #3 for this age group)

- If left untreated, HIV can lead to the disease AIDS (acquired immunodeficiency syndrome).
- The human body can't get rid of HIV and no effective HIV cure exists. So, once you have HIV, you have it for life.
- However, by taking HIV medicine (called antiretroviral therapy or ART), people with HIV can live long and healthy lives and prevent transmitting HIV to their sexual partners. In addition, there are effective methods to prevent getting HIV through sex or drug use, including pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP).
- First identified in 1981, HIV is the cause of one of humanity's deadliest and most persistent epidemics.

- What Is AIDS?
- AIDS is the late stage of HIV infection that occurs when the body's immune system is badly damaged because of the virus.
- In the U.S., most people with HIV do not develop AIDS because taking HIV medicine every day as prescribed stops the progression of the disease.
- A person with HIV is considered to have progressed to AIDS when:
 - the number of their CD4 cells falls below 200 cells per cubic millimeter of blood (200 cells/mm³). (In someone with a healthy immune system, CD4 counts are between 500 and 1,600 cells/mm³.) OR
 - they develop one or more opportunistic infections regardless of their CD4 count.
 - Without HIV medicine, people with AIDS typically survive about 3 years. Once someone has a dangerous opportunistic illness, life expectancy without treatment falls to about 1 year. HIV medicine can still help people at this stage of HIV infection, and it can even be lifesaving. But people who start ART soon after they get HIV experience more benefits—that's why HIV testing is so important.
- How Do I Know If I Have HIV?
 - The only way to know for sure if you have HIV is to get tested. Testing is relatively simple. You can ask your health care provider for an HIV test. Many medical clinics, substance abuse programs, community health centers, and hospitals offer them too. You can also buy a home testing kit at a pharmacy or online.
 - To find an HIV testing location near you, use the HIV Services Locator.
 - HIV self-testing is also an option. Self-testing allows people to take an HIV test and find out their result in their own home or other private location. You can buy a self-test kit at a pharmacy or online. Some health departments or community-based organizations also provide self-test kits for free

How Do You Get or Transmit HIV?

- You can only get HIV by coming into direct contact with certain body fluids from a person with HIV who has a detectable viral load. These fluids are:
 - Blood
 - Semen (cum) and pre-seminal fluid
 - Rectal fluids
 - Vaginal fluids
 - Breast milk

- For transmission to occur, the HIV in these fluids must get into the bloodstream of an HIV-negative person through a mucous membrane (found in the rectum, vagina, mouth, or tip of the penis); open cuts or sores; or by direct injection.
- People with HIV who take HIV medicine daily as prescribed and get and keep an undetectable viral load have effectively no risk of sexually transmitting HIV to their HIV-negative partners.

Host

- Age- Most cases are among sexually active people aged between age 20- 49 years.
- High risk groups-
Male homosexuals, hetero sexual partners, i.v. drug abusers, blood transfusion recipients, haemophiliacs and patients having STDs.

HIV Transmission

- HIV enters the bloodstream through:
 - ^ Open Cuts
 - ^ Breaks in the skin
 - ^ Mucous membranes
 - ^ Direct injection
